# BrandCheck

A review desk for content that needs to sound, look and read like your brand before it goes live.

The idea: A creator brings a draft to BrandCheck. The product checks it against approved brand sources, explains each issue, suggests a correction, and sends the exact revision to a human reviewer for a decision.

## Why this matters

As teams grow, posts, emails, documents and visuals come from many people and tools. A retired product name, unsupported promise, inaccessible image or wrong asset can reach the public before a brand manager sees it. BrandCheck moves that discovery into the pre-publication workflow.

### For creators

Get specific, source-linked feedback and optional edits without losing the purpose of the draft.

### For brand teams

Keep one approved policy, reusable assets, decision history and visibility into recurring issues.

### Explore the working product

Public interactive example - review a fictional NovaDesk launch draft without signing in.

Shared workspace - sign in for saved guidelines, roles and review history.

Source code - product implementation and technical documentation.

BrandCheck supports a decision before publication; it does not publish the content itself.

01 / THE PRODUCT JOURNEY

# From draft to accountable decision

The central workflow connects approved source material to a reviewable content revision. Each step leaves the creator and reviewer in control.

**Creator**
Writes or imports a draft, checks findings, revises content and submits a version.

**Brand manager**
Maintains approved terminology, messaging, evidence and asset guidance; reviews policy proposals.

**Authorised reviewer**
Reads the submitted snapshot, comments, asks for changes or approves with a reason.

**Organisation**
Sees repeated errors and policy gaps, with an audit trail of content and decisions.

| Step | What happens | Why it matters |
|---|---|---|
| **1. Define** | Add approved guideline sources, retired terms, evidence records and known assets. | Checks have a clear authority. |
| **2. Prepare** | Write text or extract a text-based PDF, DOCX, TXT or Markdown file. Attach an image if relevant. | One place for varied content. |
| **3. Review** | Run rules and, with consent, Gemini analysis against active approved sources. | Issues appear before publication. |
| **4. Resolve** | Inspect cited evidence and optional suggestions; edit, apply a verified term fix, or dismiss with a reason. | The creator keeps editorial control. |
| **5. Submit** | Freeze the checked revision and assign it for human review. | The reviewer sees the exact version. |
| **6. Decide** | A separate reviewer comments, requests changes or approves. A later edit needs a new check. | Approval stays accountable. |
| **7. Learn** | Inspect history, recurring issue categories and policy changes that affect old drafts. | Guidelines can improve over time. |

Two ways to try it: /example is a device-local, fictional sample with a simulated role switch. /workspace is the saved, authenticated team workflow with server-enforced permissions.

# A concrete review example

Take this fictional launch line from the public example:

> Draft: "Flowly guarantees 2x productivity for every team. Meet the future of work."

| Issue | What BrandCheck explains | Source and next step |
|---|---|---|
| **Retired name** | "Flowly" is retired; "NovaDesk" is approved. | TERM-001. Replace the term if this is the intended product. |
| **Measured claim** | "2x productivity" needs current approved evidence; the app does not call it false. | CLAIM-001. Attach evidence or remove the measurement. |
| **Absolute tone** | "Guarantees" may overstate the promise and depart from the calm, specific voice. | TONE-001. Rewrite with narrower wording for a person to assess. |
| **Image access** | The meaningful sample graphic has no alternative text. | ACCESS-001. Describe it or mark it decorative if appropriate. |

## What a finding contains

Each finding identifies the category, severity, exact excerpt or image location, approved source ID and version, reason for the flag, and a suggested next step. The review priority index is a heuristic for triage, not a legal, factual or accessibility certification.

## Corrections are optional

A verified terminology fix can be applied with one click. Broader rewrites remain suggestions and require a new review. A person can also dismiss a finding with an explanation. Unsupported claims are never silently rewritten into supposedly verified claims.

## Uncertain image analysis

Exact approved-image fingerprints and missing alt text are rule checks. Optional AI visual observations are separate, unverified leads. An authorised reviewer must inspect the original image and confirm or dismiss a lead before it counts as a finding.

03 / CAPABILITIES

# What teams can do today

### Guideline library

Store versioned messaging, terminology, claim policy, evidence and asset rules. Stage changes as proposals before activation.

### Text and document intake

Review plain text, Markdown, text-based PDF and DOCX. Findings map to document pages or paragraphs.

### Image guidance

Check approved SHA-256 fingerprints, alternative text, explicit text contrast and graphic palette heuristics.

### Grounded AI review

With consent, ask Gemini for semantic tone and claim leads. Keep only findings tied to an active approved source and visible draft excerpt.

### Human workflow

Persist drafts, comments, assignments, source versions, revision history and separate reviewer decisions.

### Governance insights

See repeated issue categories, policy gaps, reviewer outcomes and drafts affected by guideline changes.

## Format and workflow boundaries

| Input | Supported path | Important boundary |
|---|---|---|
| **Text** | Write in the guest example or saved workspace. | Shared drafts are limited to 10,000 characters. |
| **PDF / DOCX** | Extract text in the browser; review page or paragraph-linked sections. | Scanned PDFs need OCR; visual page coordinates are not preserved. |
| **TXT / Markdown** | Import as plain text for review. | Layout and rich formatting are not preserved. |
| **Images** | Attach a graphic for asset and accessibility checks. | Hash matching proves exact identity; palette checks are heuristics. |

Policy changes have consequences: Activating an updated guideline can recheck saved drafts and move affected content back into a review-needed state. The public policy lab demonstrates the concept without changing a shared database.

04 / ARCHITECTURE & TRUST

# How it works behind the screen

BrandCheck is a React and TypeScript application running on Cloudflare Workers. The browser performs document extraction; the same-origin API handles authenticated workspace actions and optional AI review.

| Layer | Responsibility |
| --- | --- |
| **Browser** | Editor, document extraction, local checks, file preview and review interface. |
| **Worker API** | Validates requests with Zod, checks membership and roles, coordinates review and audit actions. |
| **Cloudflare D1** | Stores workspaces, policies, drafts, members, findings and append-only activity events. |
| **Google Gemini** | Receives consented draft text and approved sources for semantic review; a separate opt-in visual action can send a reduced preview. |

## Privacy and human control

### Local file processing

PDF and DOCX binaries are parsed in the browser. A creator chooses whether extracted text is saved to a workspace.

### Explicit AI disclosure

The interface identifies when Gemini is used and asks for consent before sending saved draft material or a reduced image preview.

### Server permissions

Workspace roles are enforced in API actions. A creator cannot approve their own submitted content.

### Versioned decisions

A reviewer decides on a frozen revision. Later edits invalidate approval and require a new check.

Reliability principle: Source IDs and versions must match active approved material. Simulated AI output and unsupported model explanations cannot become real source-grounded findings. If AI is unavailable, rule-based review remains available.

Technology: React 19, TypeScript, Vinext/Vite, Cloudflare Workers and D1, Drizzle ORM, Zod, PDF.js, Mammoth, fflate and Google Gemini 3.1 Flash-Lite.

# Built to be useful, with clear limits

The public guest example, document desk and policy lab are available without a login. Saved collaboration requires authentication. Local verification of the current source passed 47 service and helper tests, strict TypeScript and a production build.

## Known limits

| Area | Current limit |
| --- | --- |
| **Facts and claims** | Checks against approved internal evidence. It does not independently crawl the web or certify a third-party study. |
| **Documents** | Text-based extraction only: up to 15 MB, 40 PDF pages, 400 DOCX paragraphs and 80,000 extracted characters. |
| **Visual review** | No full logo-clearance measurement, OCR for scanned documents or automatic aesthetic judgement. AI visual leads need human confirmation. |
| **Integrations** | Public GitHub JSON policy import is on demand. Private CMS connectors and automatic background synchronization are future work. |
| **Operations** | The audit log records application events; it is not a cryptographically signed compliance certificate. |

## What we would build next

1. Private document and CMS connectors so approved guidance stays current across tools.
2. Scanned-document OCR and richer image checks with reviewer verification.
3. More flexible approval routing, notifications and governance reporting.

Try it: Interactive example | Document desk | Policy lab | Source repository

BrandCheck is a pre-publication governance tool. Its findings support a person making a decision; they do not replace legal, factual or accessibility review where those are required.
